

Fahrenheit vs. Celsius

Celsius vs Fahrenheit

- The equation for Fahrenheit vs. Celsius graph is $y=1.8x+32$
 - This makes sense because there is a direct correlation; fahrenheit being 1.8 times the celsius plus fahrenheit's base freezing point of 32 degrees
-

- The best type of graph for the time vs temperature graph is a linear graph
- the equation for Celsius is $y=1191x-660$
- the equation for Fahrenheit is $y=2144x-1155$
- this makes sense for representing temperature because it shows how the temperature changes over a time period. It shows the rate, whether it is increasing or decreasing, and temperature at any given time.
